Apple Weather App Integration of Water Information:

The Apple Weather app contains a variety of information like air quality, temperature, sunrise and sunset times, waning gibbous, and severe weather notices like fires and floods. To enhance the app's functionality and user experience we aim to integrate water data into the application to bring important real-time environmental information to users. This could include water quality, surface water temperature, tides, and potentially more.

Information Wireframes

A widget in an existing weather app (like Apple Weather) that expands when tapped to reveal more detail about water temperature over time, potential future predictions based on trends, and water gage details.
